

What fires the trigger vs plastic threshold
(single-arm SiPM $\wedge$ plastic, SiPM ≥ 0.5 MIP)

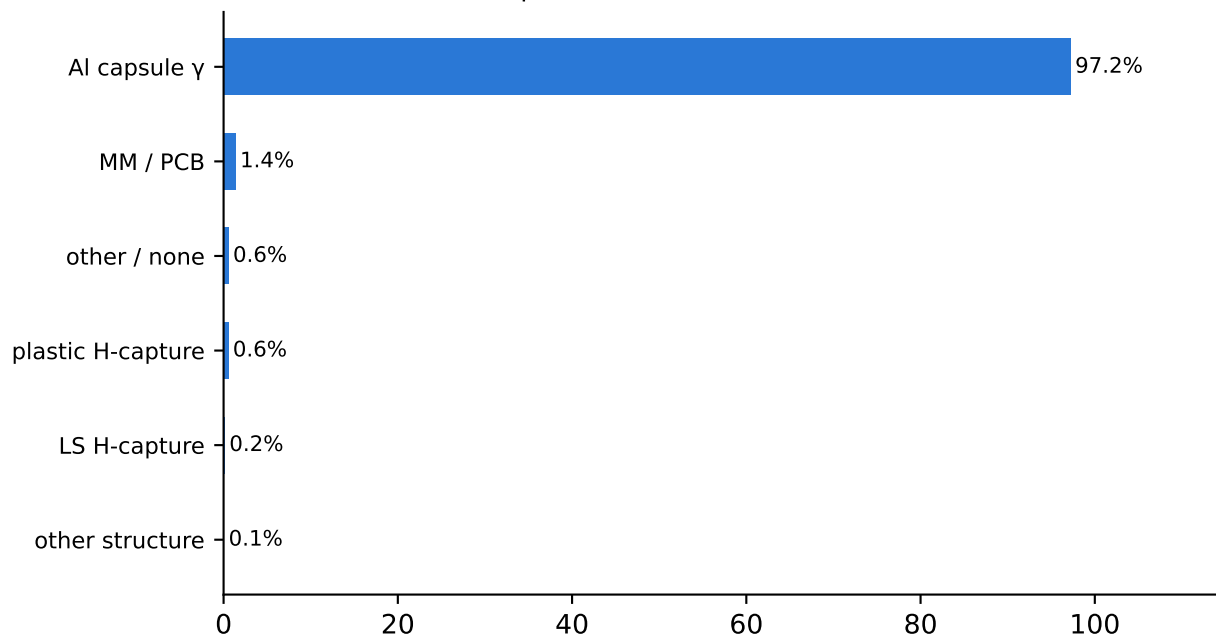

Signal survival vs plastic threshold

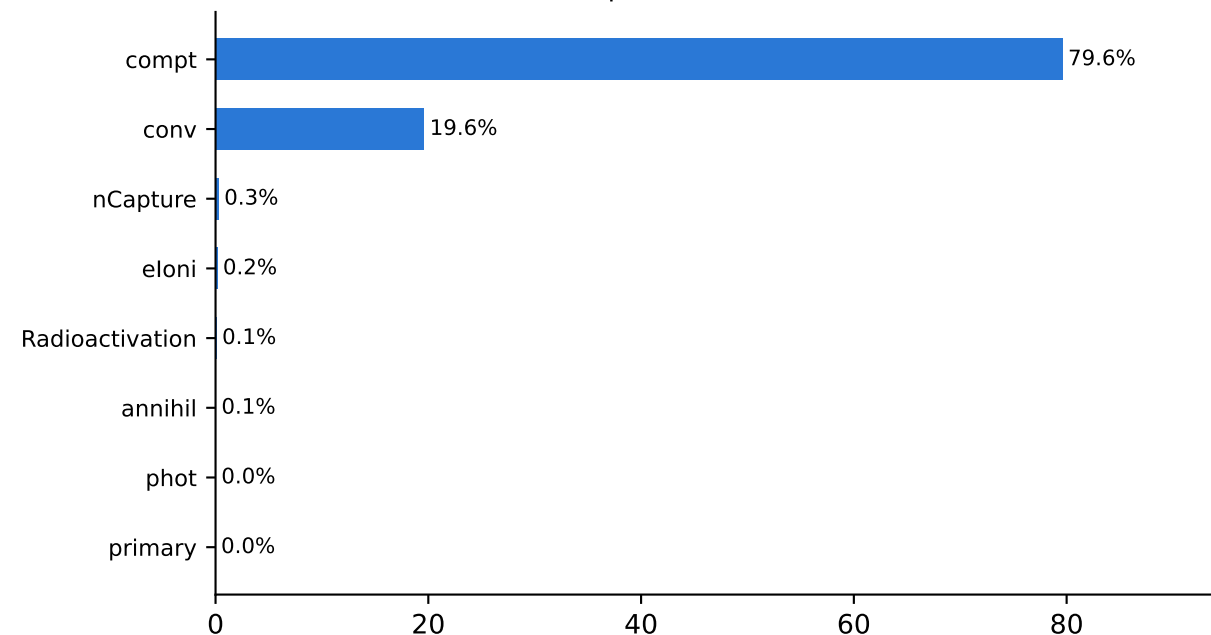

How the trigger background gets made — nominal b=0.5 MIP (122 legs/pulse; 98% one crossing track)

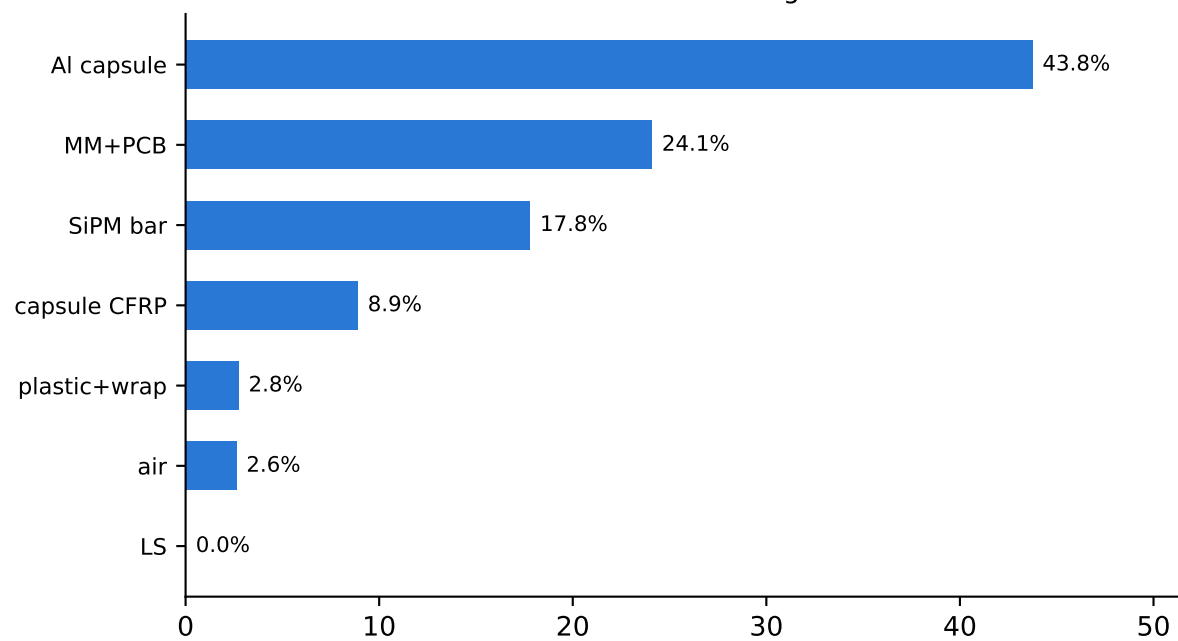

capture site (what the neutron did)

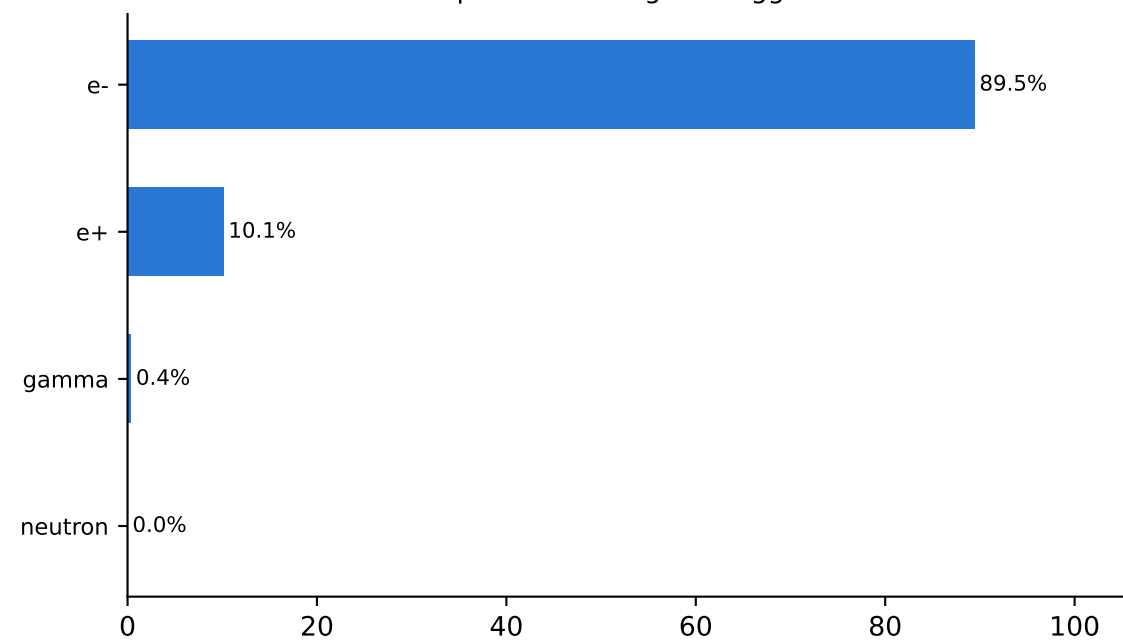

birth process (mechanism)

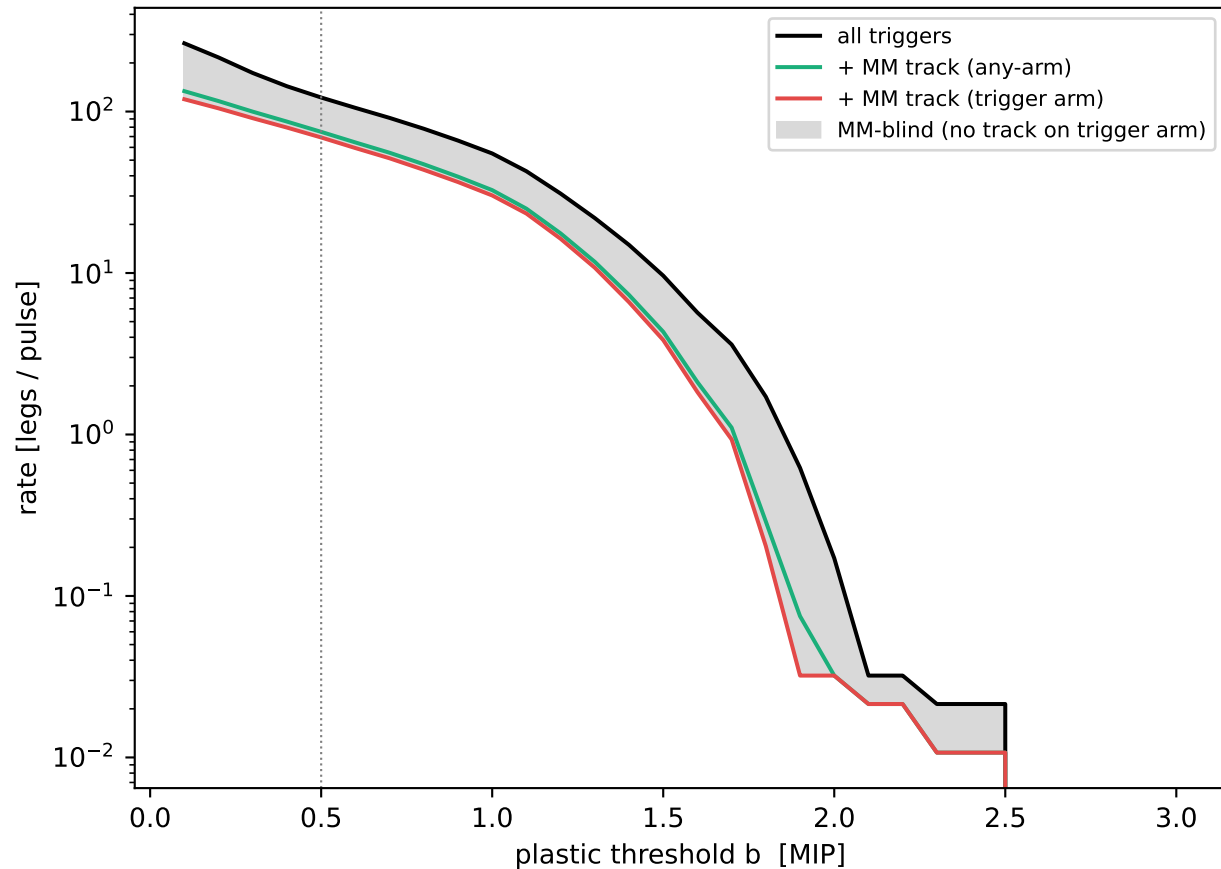

birth volume of the leg track

species crossing the trigger

Trigger vs Micromegas: how much is MM-tagged

MM-tag fraction of triggers vs threshold
